Routed Forecast - Final Resolution Study

Management Outcome Report | 18 Sep 2026

OUTCOME C - UNRESOLVED REPRODUCIBILITY BOUNDARY

The routing study stopped at Stage 0. The exact historical candidate coordinate required for legal routing selection is not durably reproducible from the surviving repository artifacts.

Executive summary

The interrupted research branch recovered cleanly. Before this continuation wrote anything, research/future-state-resolution-phase34-resume was exactly at the prior Stage C Outcome B commit 11399fb1fbfb89d99e38250d31b72dc2dbbc78fa, with zero later commits. No Routed Forecast final-resolution work had been durably completed or lost.

Stage 0 then audited the frozen candidate evidence. Earlier work recorded a 41,344-row aligned prediction file for Candidate B, R1 and R2 and preserved its SHA-256, but that row-level file is not committed on the live branch. B2a and H2 survive as method/result checkpoints rather than an exact aligned row coordinate or complete frozen fitted artifacts sufficient to reproduce row outputs without refitting.

Because routing requires candidate-by-position and candidate-by-career-state comparisons on identical chronological rows, aggregate summaries cannot legally substitute for the missing coordinate. The study therefore stops at the reproducibility boundary rather than inventing a workaround.

Recovered evidence

- Live research boundary: Stage C Outcome B at 11399fb1...; no later routed-study commit existed before recovery.
- B2a: definition and aggregate pre-holdout behavior survive in the B2 and corrected rejection-audit checkpoints.
- R1/R2: hybrid provenance audit records aligned prediction evidence with 41,344 rows and prior metric parity.
- H2: family definition and aggregate mid/validation results survive; exact aligned row outputs and complete fold-specific fitted restoration artifacts do not.
- Protected state: main 53ff3a3c...; PR #147 open/unmerged at 3e63cd616...; no production authority changed.

Exact Stage 0 failure

The prior hybrid provenance audit names recombination_prediction_rows.csv, reports 41,344 rows, and records SHA-256:

dbd1b1b5fd7fe7c6c43c2e6bda417db192c852f136ac704a7a5abb48fae2288b

Comparison of the B3 result commit 86043a6610bc4dce79a159502f24cb70a762fab to the final hybrid result commit 8839cfad99ec4850782d5bc720784d0672012472 shows only two added files: the hybrid Stage 0 provenance Markdown and final checkpoint Markdown.

The aligned row CSV was not committed.

The current final candidate universe also requires B2a and H2 on the same legal pre-holdout coordinate. Their durable summaries do not contain the row-level predictions or complete frozen fold-specific fitted parameters required to reproduce exact outputs without a new refit.

Smallest missing dependency

An exact, aligned, pre-holdout row-level candidate coordinate for B2a, R1, R2 and H2 - or the exact frozen fitted artifacts/parameters plus source rows sufficient to reproduce those predictions without refitting or making a new methodological choice.

Why summaries are insufficient

The unresolved question is whether different already-developed treatments are systematically superior for populations identifiable at the forecast cutoff. Legal routing requires the same historical player rows, source-time position/career-state evidence, fold membership, horizon, candidate prediction and realized outcome. Aggregate MAE summaries cannot produce cell sample sizes, fold stability, position-only routing, position x career-state routing or the complexity challenger.

What was not done

- No candidate parity was claimed on an invented or substitute coordinate.
- No career-state definitions or routing cells were selected.
- No position-only or position x career-state challenger was fit or evaluated.
- No holdout or current-player board was used for routing discovery or tuning.
- No Forecast model was refit or rerun in this continuation.
- No main, PR #147, production, Intrinsic/Shapley, Constitution, C=0.25, merge, deployment or promotion change occurred.

Management implication

Do not interpret Outcome C as evidence that B2a won the routing study. The study never reached routing selection. B2a remains the protected provisional fallback because that was the governed starting state, not because this final study proved it superior.

The bounded next decision is procedural: recover the exact missing candidate coordinate and resume at Stage 0 parity, or accept the reproducibility boundary and move forward with the already-protected B2a fallback. This report authorizes neither production promotion nor a new Forecast research family.

Durable repository record

- Recovery note commit: da88ba09f92eb9cd35db201e88a88be61286ee1c
- Stage 0 boundary commit: 4f5a41d69c59f4853eeb7f4985a0b5391cff33d3
- Machine-readable Outcome C commit: 1c0ae590e232958830aa317fbe92baa6784ea1be
- Plain-English management summary commit: fac381fb345d51e3ab64d1f58bf40b58b8952a31

Execution accounting

Model reruns: 0. Model refits: 0. Current-board runs: 0. Holdout routing runs: 0.

The earlier hybrid study explicitly noted that its prior wall-clock runtime was not durably recoverable. This continuation does not invent a historical runtime figure. Its work was repository recovery, artifact/provenance inspection and fail-closed checkpointing only.

STOP FOR MANAGEMENT REVIEW

No further Forecast research action is authorized by this continuation.
