Preseason Baseline Authority Restoration - Stage A Stop Report

19 Sep 2026 | Implementation-only source-authority diagnostic

Final classification: C - PRESERVED BASELINE PERSISTENCE/RUNTIME ACCESS DEFECT BLOCKS SAFE USE

Executive result

The directive cannot safely advance past Stage A because the exact preserved production preseason_forecast_baseline record is not accessible through the currently connected production surfaces. The baseline code contract exists, but the required production record itself cannot be decoded or materialized from GitHub, the PR diagnostics, or the connected Render database surface.

No fresh provider board was substituted. No model fit, tuning, provider weighting, merge, or deployment occurred.

Protected repository state

main: 53ff3a3c2e79a59d1e4d8bbdfbb293b10f978b76

PR #147: open / unmerged

PR #147 head at final recheck: 218d2b315e06b5c5ae3df1161652c4e8f09366c1

PR #117: merged at a96c5536fec8824a1729cf4078d84fb57f225464

Stage A evidence

Target persistence key: artifact_kind=preseason_forecast_baseline; scope_kind=league_season; model_version=next2-preseason-baseline-v1.

- Hosted Render service is active and durable persistence is evidently in use, but no Render-managed Postgres resource is exposed in the connected Render workspace.
- The PR #147 diagnostic workflow runs with FSFFL_DATABASE_URL and FSFFL_DIAGNOSTIC_LEAGUE_ID blank, so it cannot query the production persistence record.
- Render logs from 2026-09-01 through 2026-09-19 contain no baseline-capture or baseline-fallback event that can prove the exact artifact indirectly.
- Prior repository/workflow recovery established that the exact old 335-player PR147 Year-1 vector is not durably stored in repository/workflow artifacts; only named values, hashes, and partial rows survive there.
- Therefore the exact preserved production baseline record cannot be decoded, its invalidation state cannot be proven, and the required 335-player board cannot be materialized from the exact artifact.

Surviving prior PR #147 named Year-1 evidence

Bijan Robinson 329.24 | Jahmyr Gibbs 328.02 | Christian McCaffrey 315.36 | Sam Darnold 281.73 | Aaron Rodgers 243.70

These named values are prior durable evidence only. They cannot substitute for the exact production baseline object. Puka Nacua and Josh Allen checks cannot be proven from that object while it remains inaccessible.

Current code-path map and bypass

baseline model: src/fsffl/forecast/preseason_baseline.py

persistence codec/key: src/fsffl/persistence/runtime_cache.py

resilient loader: src/fsffl/product/forecast_resilience.py

hosted runtime wiring: src/fsffl/product/persistent_webapp.py

PR147 Year-1 consumer: src/fsffl/product/private_beta_shapley_runtime.py

- make_resilient_forecast_loader retrieves a preserved baseline record, but still calls live_loader first and returns live evidence whenever live acquisition succeeds.

- PrivateBetaShapleyContractLoader consumes context.forecast_evidence.league_scored_forecasts for Year 1, so it inherits whichever coordinate populated runtime context.

- Fresh live full-season evidence can therefore still be preferred over the preserved preseason baseline for the frozen Year-1 Intrinsic coordinate.

Concurrent PR #147 change

PR #147 advanced during this execution to commit 218d2b315e06b5c5ae3df1161652c4e8f09366c1, message: Restore preseason baseline as explicit Year-1 authority.

That change is incomplete: build_runtime_from_preseason_baseline now references PRESEASON_AUTHORITY_RUNTIME_VERSION, but that symbol is not defined in preseason_baseline.py. The resilience loader also remains live-first.

Existing CI did not detect this because the passing focused tests do not execute the concrete baseline materialization path under the new symbol.

Regression status

The current live-diagnostics workflow reports 18 focused tests passing, but its environment shows FSFFL_DATABASE_URL and FSFFL_DIAGNOSTIC_LEAGUE_ID blank. That successful run cannot prove the production baseline record.

Required invariants are not mechanically proven: baseline-first Year-1 authority; live-drift quarantine; provenance/evaluation timestamp retention; distinct live/current semantics; and fail-closed behavior when the frozen baseline is unavailable.

Execution accounting

Model fits: 0 | Forecast tuning: 0 | Provider-weight changes: 0 | Forecast/Intrinsic semantic changes by this execution: 0 | Merge: no | Deploy: no | Fresh live board used as substitute: no

Smallest next governed action

Expose a read-only path to the production persistence record, or supply an exact export of the valid non-invalidated preseason_forecast_baseline record. Stage A can then decode it, prove ≥ 2 -source provenance/evaluation timestamp, materialize the exact 0.5-PPR 335-player board, and verify named-player parity. Only then may Stage B complete the baseline-first source-authority correction and regression tests.

STOP FOR MANAGEMENT REVIEW. Do not use fresh live provider pages as a substitute, do not complete the source-authority code change, do not reopen Forecast/Intrinsic research, merge, or deploy.
