Forecast Deployment-Specification Recovery

Outcome C - Specification Not Recoverable From Durable Evidence | 18 Sep 2026 directive

Recovery is complete. The historical B2a and R1/R2 prediction evidence is durable, but the exact deployment-grade fitting specifications and the unique final 2026 training-cutoff rule are not recoverable from the durable evidence available to this task. No model was fit, replayed, approximated, tuned, or run on current players.

Recovery scope completed

Surface searched	Result
Live research tree	997-entry recursive tree; exact architecture-spec file absent
Historical commit trees	B2-era and recombination-era trees checked; exact spec absent
Relevant research branches	10 Forecast/research branch trees checked; no deployment spec/config found
GitHub history/search	Exact filename and recorded SHA-256 searches returned no match
FSFFL NEXT Library	795 files recursively reviewed plus exact phrase/hash searches; no spec/code/config
Prior/current generated artifacts	Prediction rows and reports survive; lost estimator package does not

Durable prediction evidence

B2 prediction rows: 16,689 rows; SHA-256 9eda45f36786c0c73a190566b9eb14d199a604427112c890488f2d5a2cdaacb6.

R1/R2 recombination rows: 41,344 rows; SHA-256 dbd1b1b5fd7fe7c6c43c2e6bda417db192c852f136ac704a7a5abb48fae2288b.

Candidate-B ancestor rows: 22,252 rows; SHA-256 4298b40667906fca5a88ad823313e57c0c5971b5eef9c6b38f55f5f5155bd3f5.

B2a - exact remaining boundary

The durable record fixes the high-level B2a form: a five-bin monotone nonlinear within-position production-percentile correction in log-point space, partially pooled by position/horizon with $n/(n+50)$ shrinkage toward a global bin effect. What does not survive is the deployment precision needed to instantiate one unique fit.

Unresolved: exact bin-edge/tie construction; exact monotonicity enforcement; the exact fast-track Candidate-B estimator and design matrix; complete transforms; target/log-space application; inverse transform; floors/caps/missing behavior; and deterministic implementation details.

R1/R2 - exact remaining boundary

The architecture is recoverable conceptually: frozen persistence and ordered future-state probabilities; player-specific production inside each positive future state; R2 adds only the governed two-prior-season consistency evidence. The two-prior component itself is durably documented.

The missing deployment object is the exact R1 learner that R2 extends: estimator/model family, design matrix and transforms, regularization, position/horizon/state pooling and shrinkage, support/fallback rules, target/back-transform, deterministic state-combination order, and the exact R2 augmentation algebra.

A prior Stage-0 provenance audit recorded ARCHITECTURE_SPECIFICATION.json with SHA-256 197acd61b3420c6664e171c00a24e7d2a19b91ee1fcf8e2ec91ab6e307dee9cc. The exact bytes were not recovered from the repository, inspected historical trees, relevant research branches, Library, or available generated-artifact surfaces.

Final training cutoff remains ambiguous

The governed PIT panel extends through 2025 and supports horizon-specific latest-observable source seasons, including Y2 source 2023 and Y3 source 2022. Separately, an earlier selected-routed current materialization used completed source seasons through 2022 for both future horizons. No durable B2a/R2 post-selection deployment rule was found that chooses between those conventions for the 2026 board.

Selecting one now would be a new training-window decision, so this recovery does not choose.

Why no replay was run

A deterministic historical replay is authorized only after exact frozen-recipe recovery. Because deployment-critical fields remain unresolved, a replay would require filling those gaps and would become reconstruction or reverse engineering rather than verification.

Final management outcome

Outcome C - Specification Not Recoverable From Durable Evidence. The smallest remaining dependency is an authoritative deployment-grade B2a and R1/R2 specification package plus the mechanical final-cutoff rule. Recovering the recorded architecture-specification bytes would materially narrow R1/R2, but would not by itself resolve B2a or the cutoff.

Execution action	Count
Model fits / refits	0
Historical fit replays	0
Hyperparameter searches	0
Reverse-engineering attempts	0
Final-cutoff choices	0
Current-player board materializations	0
Current-player credibility judgments	0
Production / downstream changes	0

Research start head: 2f2d5f056126e8a7fd08751414be7374acb3d3c1. Main remained 53ff3a3c2e79a59d1e4d8bbdfbb293b10f978b76. PR #147 remained open/unmerged at 3e63cd61602d0832acf0a30dcc5bee0b13ceeb63. Final recovery head is recorded in the durable repository manifest committed with this report.

STOP FOR MANAGEMENT REVIEW.
