Forecast Post-Freeze Current-Player Credibility Gate

Outcome C: Reproducibility / Coordinate Boundary | 18 Sep 2026

The final routed Forecast cannot be materialized exactly on the 335-player current board without a new model fit. The gate therefore stops before any current-player credibility judgment. No model was rerun, refit, retuned, or repaired.

What is available and frozen

Object	Status	Key identity
Final routing rule	Available	B2a default; R2 only for selected QB career-state/horizon cells
Governed Y1 board	Available	335 players; SHA-256 c668b74b...c0b3f
Current identity/history coordinate	Available	335 rows; SHA-256 95fd6565...cda1
Current B2a fitted treatment	Missing	No frozen final-current-cutoff parameter/materialization package
Current R2 fitted treatment	Missing	No frozen final-current-cutoff state-conditional learner/materialization

Why the boundary exists

The historical B2a study generated rolling-fold historical predictions but explicitly did not run the preserved 335-player current board. The R1/R2 recombination study did the same: it produced historical fold predictions and stopped without a current board. The later routed-Forecast study selected among those already-produced historical predictions; it did not create a new final-current-cutoff fit for B2a or R2.

That distinction matters because both treatments need fitted current-cutoff machinery. B2a needs its final five-bin production correction parameters, while R2 needs its fitted state-conditional production learner and frozen multi-year consistency terms on the current cutoff. The recovered historical prediction rows are not those current-cutoff fitted objects.

Why the older current-player sentinel cannot substitute

A prior 335-player current-player pathway exists, but it belongs to a different Forecast candidate: the earlier fixed routed Forecast plus M1a and two-prior-season consistency. Reusing its Y2/Y3 outputs as though they were B2a/R2 would change the model under inspection. The new gate explicitly forbids substituting an older board.

Smallest missing dependency

A durable, provenance-locked final-current-cutoff B2a/R2 fitted treatment package - or a row-complete 335-player materialization produced from that already-fitted package - containing the exact B2a correction and R2 state-conditional production machinery required to generate final-route Y2/Y3 predictions.

Creating that package now would require fitting or re-estimating B2a and/or R2 on historical evidence through the current cutoff. Even if the historical algorithms are deterministic and already documented, that is still a model refit. This credibility gate explicitly prohibits refitting.

Scoring-coordinate consequence

The governed Y1 raw fantasy-point coordinate is available. Final-route Y2/Y3 persistence, conditional-active points, unconditional expected points, and future-state probabilities are not available without the prohibited fit. Therefore an apples-to-apples Y1/Y2/Y3 comparison cannot be completed, and no conclusion about elite compression or veteran longevity is made.

Board disposition

No 335-player final-route CSV/XLSX was generated. Producing one with blank or older Y2/Y3 fields would not satisfy the directive and could be mistaken for the frozen final Forecast. The absence of that board is part of the Outcome-C boundary.

Final management outcome

Outcome C - Reproducibility / Coordinate Boundary. The routing specification is frozen and the current Y1 plus identity/history coordinates are durable, but the final-current-cutoff B2a/R2 fitted treatment package is missing. Stop before credibility interpretation. A later management decision would be required to authorize any bounded final fit or materialization.

Protected-state accounting
